SUMMARY

Full-stack engineer, sole developer on everything I've shipped. Rebuilt a sign manufacturer's order operations from a manual C#/.NET process into a Next.js product the shop floor runs on daily, shipped a Flutter app solo, and built the x402 payment layer that lets an agent buy its own tool calls.

SKILLS

TypeScript, Python, C#, Dart, SQL • React, Next.js, Flutter, Node.js, .NET Core • PostgreSQL, Prisma, SQL Server, Firestore, Supabase • Firebase, Vercel, Git

Agentic / LLM — Claude, OpenAI, Gemini, Groq APIs; CrewAI, Tavily. Schema-validated tool calling, multi-agent role and tool boundaries, structured JSON outputs, retrieval grounding, x402 machine-to-machine payments

EXPERIENCE

Sigo Signs — Software Trainer → Internal Tools Developer | Norwood, NJ | September 2025 - December 2025

- Rebuilt the order workflow the shop runs on — replaced a manual C#/.NET process with a **Next.js + TypeScript order management product** (data model, live status pipeline, ops dashboard), now used daily across 6,000+ active orders. Scoped directly with the ops staff who use it.
- Wrote the **Python batch pipeline** behind fulfillment: 100k+ file operations a day with throttling, retry logic, and permission-aware error handling, plus dry-run/apply modes and CSV audit trails so non-technical staff could verify a run before committing it.
- Designed the **.NET Core REST API** that became the standard data-access layer for 3 internal teams (controllers, services, dependency injection, Swagger), with server-side pagination via Prisma **\$queryRaw** and SQL window functions to keep reporting responsive as the order table grew.

StackedLabs — Founder & Engineer | NYC | Jan 2026 – Present

- Shipped **BodyCraft**, a Flutter/Firebase calisthenics app, solo to web — skill progression system, live battles arena, 114-workout library, onboarding, real-time Firestore sync, Google/email auth.
- Building **Oro Latino**, an interactive canvas storefront for a NYC jewelry retailer: Verlet-simulated draggable chains, procedurally rendered gold links, bilingual Spanish/English product copy. The client's lead-capture front door, not a static site.
- Diagnosed and fixed the rendering regression that dropped that scene to ~5fps — stamped run-sprites instead of per-link draws, cut per-frame canvas state churn, added a sleep/composite path. Back to **60fps idle at one draw call per frame** on a 4.1MB atlas.

PROJECTS

ShopAtlas — Agentic commerce assistant | NYC Tech Week Hackathon | Team of 5

- Built the **x402 payment layer** — the agent's checkout path. Revives HTTP 402 so the agent pays per API call in USDC over a single round trip: no account, no API key, no human in the payment loop.
- Wired it into a teammate's Tavily retrieval service and gated it: explicit human confirmation before any purchase executes, restricted-product queries blocked and logged, no credentials persisted in plaintext.

Ask Adam — recruiter-facing agent | React, TypeScript, Groq API | ai-agent-pitch.vercel.app

- Built a chat agent grounded in a single canonical facts file so it answers recruiter questions about my background without drifting from what's verifiable.
- Shipped the **JD Fit Rater**: paste a job description, get a scored alignment breakdown against my actual shipped work.
- Built a **62-case eval harness** for that agent across four grading layers — deterministic checks, grounded-entity matching, abstention tests, LLM-as-judge — with a consistency grader that flags when the fact ledger drifts from the live prompts. Debugged a silent multi-hour hang to a 100k-token daily cap on the judge model, invisible from outside; fixed with per-call timeouts and incremental result writes so one stuck case fails alone instead of freezing the run.

EDUCATION

Manhattan University — B.S. Computer Information Systems, Minor in Computer Science | May 2025

Coursework: Data Structures & Algorithms I/II, Object-Oriented Programming (Java), Database Systems, Discrete Structures, Data Mining, Data Privacy, Business Statistics

Activities: GDSC Lead Tech Developer, ACM, CodePath, ColorStack, Division I eSports (Super Smash Bros. Ultimate)
